

Dear candidate,

Thanks for applying for the Backend engineer position in Mytheresa.

We would like to propose a little technical challenge for you. This will help us evaluate your skills better and see how they could potentially strengthen our teams.

What we ask you is to write a REST API in the language of your choice. You don't need to overcomplicate it, it's more important the quality of the code than the feature completion.

1. Develop a REST API with:
 - One endpoint to add item to cart
 - One endpoint to retrieve the items on a cart
2. Add the automated tests you feel are necessary.
3. **BONUS** Dockerize it.

Upload your code to GitHub once it's done.

Any questions please ask.

The development team.
